The Marvel Fabrication Scuba Cylinder Transport Caddies were originally an item created just for personal use.

Shayne is a qualified Scuba diver and a Certified Equipment Specialist.

A light bulb moment and some free time, saw the creation of the first design. After other divers saw his creation and gave some great feedback, we thought there may be a market in Australia, as the closest thing we have come across are the Foam Tank Holders.

Yes, they are more expensive than their foam cousins, they are not made on a production line. Each one is made from rust proof aluminium and laser cut, shaped and welded in our factory by hand. They are then sent to be powder coated for extra protection and to enhance longevity and aesthetics.

They are designed in a way that they can be mounted into a Ute, truck tray or boat either laying flat or standing vertically. Mounting is not necessary unless storing vertically, rubber stoppers on the bottom help keep them right where you put them. They also fit perfectly in the boot of any small or midsize sedan.

The design ensures that they will not tip over and the straps give extra security in keeping cylinders in place.

More design features such as wheels and handle, storage add-ons for items such as dive weights and a new flat bed design with the ability to store twin tank set-ups without having to take them apart are all currently in the works.
